12/9/07

Boronia Towbars Pty Ltd, established in 1973, manufacturer of towbars and hitches for the Australian motor vehicle industry.

I had replaced our compressor in 2004 as it was far too small for our requirements, and in 3 years had to make a decision to either upgrade compressor again or look at any alternatives, which led me to EARS.

In June 2007 I had the Exhaust Air Recycling System (EARS) installed.

As mentioned above, the prime reason for installing EARS was that our air compressor was working overtime trying to keep up with our ever increasing demand for air to run our impact wrenches and grinders.

This was obviously costing more money due to the large consumption of power every time the compressor started and there was also the noise factor to take into account.

After installing EARS the air compressor now works less than half the time it was prior and an added benefit is the noise reduction in the air tools operation obtained due to EARS, creating a better and safer working environment.

As it is too early to fully review my running costs, I have no doubt that there will be a large cost saving in power consumption due to the fact that my compressor is not operating as often as it was before the installation of EARS.

In closing I have no hesitation in recommending EARS to any one operating a business using air tools as it has improved the working conditions in my company and also will reduce running cost considerably.

Yours Sincerely

Tony Pendock  
Managing Director
